Layered titanate: high-resolution observations

Diamond I11 | nominal temperatures from deposit folders | no fit or phase assignment

A Contour: all 5 scans

B Waterfall: 5 of 5 scans, acquisition order

Waterfall colours encode Nominal temperature (K): 300.000 to 873.000; normalization: As measured; constant offset: 17904.46170.

Fernando Pomiro, Figshare 10.6084/m9.figshare.12446306.v1, CC BY 4.0.

Rows follow selected-file order sorted by folder-labelled temperature; chronology is not independently verified.

Measured intensities unchanged; waterfall adds offsets; contour interpolation is display only.

One sigma=0 point at 0.19 degrees in the 473 K scan lies outside this view; no fitting is performed.

Contour grid: 2048 × 64 (shared 2048 x-grid; parameter interpolation to up to 512 rows). Missing values are transparent.

Colour bounds: 192.47400 to 50917.95913 (full finite range).
